## DESIGN AND SELECTION FOR INCH AND JIS STANDARDS

### STANDARD SEAL DESIGNS

Table I illustrates the 22 basic standard designs commonly used on a variety of applications.

TABLE I. Freudenberg-NOK Standard Seal Type

Body Symbols		A2	B2	B	BR	C
		Material O.D. design with an inner case for greater structural rigidity	Most standardized and economical metal O.D. design	Metal O.D. design with fluid side rubber covered.	Metal O.D. design for greater O.D. sealing ability.	Rubber O.D. design for excellent O.D. sealing ability.
Lip Symbols	S	<b>SA2</b> 	<b>SB2</b> 	<b>SB</b> 	<b>SBR</b> 	<b>SC</b> 
	T	<b>TA2</b> 	<b>TB2</b> 	<b>TB</b> 	<b>TBR</b> 	<b>TC</b> 
V	V	<b>VA2</b> 	<b>VB2</b> 	<b>VB</b> 	<b>VBR</b> 	<b>VC</b> 
	K	<b>KA2</b> 	<b>KB2</b> 	<b>KB</b> 	<b>KBR</b> 	<b>KC</b> 
WP	WP	—	—	<b>WPB</b> 	—	<b>WPC</b> 
		—	—	—	—	—

NOTE:

Metal O.D. seals are most suitable for steel or cast iron housing materials.

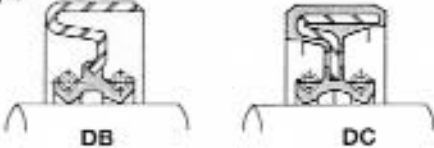

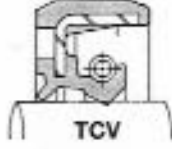

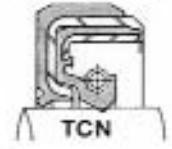

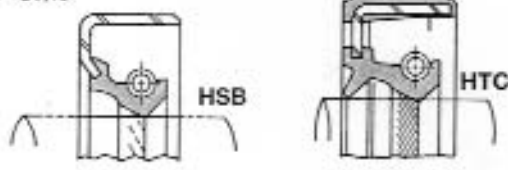

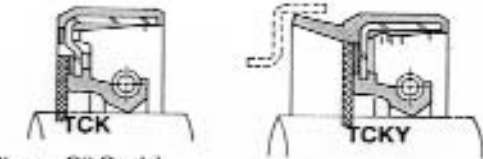

Rubber covered O.D. seals are preferred for soft alloy or plastic housing materials and are suitable as well for steel or cast iron housings. Also, this design category is best for rough bore finishes or for materials with a high coefficient of thermal expansion.

## NONSTANDARD DESIGNS

Special applications which cannot be adequately satisfied by standard designs are illustrated on Table IV.

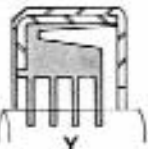

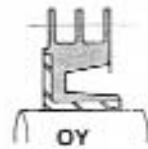

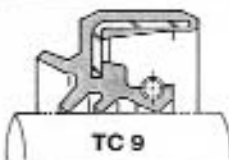

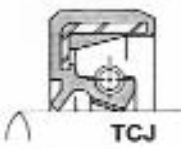

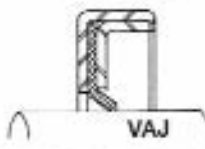

TABLE IV.

Freudenberg-NOK DESIGN	DESIGN CHARACTERISTICS
<p>"D" Style</p>  <p style="text-align: center;">DB                      DC</p>	<p>Applications which require separating two fluids from each other should use two garter spring loaded lips. The "D" style seal incorporates the two lips into one design. Note: The bore depth must be increased to accommodate the two seal lips.</p>
<p>"TCV" (Medium Pressure)</p>  <p style="text-align: center;">TCV</p>	<p>For applications up to 50 psi (3.5 kg/cm<sup>2</sup>), the "TCV" design is recommended. Pressure limit is dependent on shaft speed. Available for shaft diameters less than 2.500" (65 mm).</p>
<p>"TCN" (High Pressure)</p>  <p style="text-align: center;">TCN</p>	<p>Type "TCN" is designed for high pressure applications where continuous pressure may reach 150 psi (10.6 kg/cm<sup>2</sup>). Maximum pressure limit is dependent on shaft speed.</p>
<p>"H" Style</p>  <p style="text-align: center;">HSB                      HTC</p>	<p>Hydrodynamic sealing lips are available with majority designs. Both unidirectional and bidirectional helical ribs are available. The helical ribs help "pump" the oil weepage back under the seal lip. Basic lip design is same as standard seal.</p>
<p>"NF" (Fabric Auxiliary Lip)</p>  <p style="text-align: center;">TCK                      TCKY</p>	<p>Where dirt or dust ingestion is a problem, the "TCK" design provides superior exclusion. Where dust or dirt and moisture (small quantities of water) mixture are evident, combination with a slinger provides excellent results (TCKY).</p>
<p>"QL" (Sleeve Oil Seals)</p>  <p style="text-align: center;">QLN                      QLF</p>	<p>The "QL" seal is specially designed for mud or very dirty applications. Maximum shaft speed is limited to 10 ft/sec. (3M/sec.).</p>
<p>"T4" (Reciprocating)</p>  <p style="text-align: center;">TB4                      TC4</p>	<p>Severe reciprocating shaft applications where oil or oil-water fluid retention is desired can be effectively sealed by the "T4" design. Pressure up to 100 psi (7 kg/cm<sup>2</sup>) can be sealed, such as in shock absorbers.</p>
<p>"DK" (Reciprocating)</p>  <p style="text-align: center;">DKH                      DKB</p>	<p>Dust wiper for hydraulic cylinders. Not recommended for pressures above 5 psi (.35 kg/cm<sup>2</sup>).</p>

## NONSTANDARD DESIGNS

Freudenberg-NOK can supply a number of other special seals which are not usually standard in application nature. Table V illustrates a few of these designs.

TABLE V.

DESIGN TYPE	APPLICATION	EXAMPLE
VS	Valve Stem Seals	 VSW  VSB  VSB5
V	Special Mud Seals	 Y  OY
"5"	Flange Seals	 TC 5  TB 5
"9"	Side Lip Seal	 TC 9
"UJ"	Universal Joint Seals	 UJ  UJB
"RJ"	PTFE Seals	 TCJ  VAJ  SA1J
"O"	Rotating Bore	 OC
"E"	High Shaft Eccentricity	 SBE

## OPERATING CONDITIONS

### SEAL WITH SPRING Design Limitations

SHAFT DIAMETER	NITRILE LIP MAXIMUM CONTINUOUS SHAFT SPEED	MAXIMUM CONTINUOUS PRESSURE	MAXIMUM TOTAL ECCENTRICITY
General	3,500 rpm	5 psi	0.020"
0.500	7,000 rpm	5 psi	0.004"
1.500	6,000 rpm	5 psi	0.006"
2.500	4,000 rpm	5 psi	0.010"
3.500	3,500 rpm	5 psi	0.013"
4.500	2,600 rpm	5 psi	0.017"

NOTE: Higher shaft speeds possible using higher temperature materials such as polyacrylate, fluoroelastomer or silicone. Slightly higher continuous pressure is possible for shaft speeds below 200 fpm. Higher eccentricity is allowable if shaft speed is reduced.

### SEAL WITHOUT SPRING Design Limitations

SHAFT DIAMETER	MAXIMUM SHAFT SPEED	MAXIMUM CONTINUOUS PRESSURE	MAXIMUM TOTAL ECCENTRICITY
General	2,000 rpm	4 psi	0.005"
0.500	3,500 rpm	4 psi	0.003"
1.500	2,500 rpm	4 psi	0.005"
2.500	2,100 rpm	4 psi	0.006"
3.500	1,500 rpm	4 psi	0.008"
4.500	1,200 rpm	4 psi	0.010"

NOTE: Higher eccentricity is allowable if maximum shaft speed is reduced.

A nonsprung seal design offers a cost effective way to seal high viscosity grease applications. Because the design does not benefit from the constant load of a garter spring, the allowable eccentricity is decreased and the fluids to be sealed are limited.

### ECCENTRICITY

Eccentricity is determined by measuring the shaft run out, TIR and the shaft-to-bore misalignment. Combine the two results for the total eccentricity the seal lip must follow to function effectively. As eccentricity increases, and/or shaft speed increases, it becomes more difficult for the lip to follow the shaft.

## STANDARD MATERIAL PROPERTIES

ASTM/DIN ISO	NBR	ACM	VMQ	FPM (FKM)	HNBR (NEM)	PTFE	FPM*
<b>Wear Resistance</b>	very good	moderate	moderate	very good	moderate	good	very good
<b>High Temperature Oil Resistance</b>	moderate max. 100 C max. 80 C in heavy oil	good max. 150 C	very good max. 180 C	very good max. 200 C (max. 150 C operat.temp.)	good max. 150 C (max 140 C operat.temp.)	good max. 200 C	very good max. 200 C (max. 140 C operat.temp.)
<b>Low Temperature</b>	-40 C	-30 C	-50 C	-25 C	-40 C	-80 C	-10 C
<b>Oil Resistance</b>	good	good	moderate	very good	good	extremely good	extremely good

## SHAFT RECOMMENDATIONS

### SHAFTS

Seal and shaft compatibility is dependent on four conditions: shaft tolerance, lead-in chamfer, finish and hardness. Proper consideration of these conditions will assist in providing optimal seal performance.

SHAFT HARDNESS is an important factor to prevent excessive wear, deformation, scratches or nicks, and to allow for easy machining for proper roughness. Under normal conditions, the seal contact area of the shaft should be Rockwell C45 minimum.

SHAFT SURFACE ROUGHNESS is very important as this greatly influences the amount of lip wear. The recommended roughness is as follows:

- Rotating 10 to 20  $\mu$  inch Ra (.25  $\mu$ M to .50  $\mu$ M Ra): Rmax = 31 - 126  $\mu$  inch (0.8 - 3.2  $\mu$ M)
- Reciprocating 5 to 10  $\mu$  inch Ra (.13  $\mu$ M to .25  $\mu$ M Ra) The method of achieving this finish should not be overlooked.

Table 6  
**Recommended Shaft Chamfer**

**simrit®**

## SHAFT RECOMMENDATIONS

INCH SIZE  
SHAFT SEALS

**PLUNGE GRINDING** is recommended for rotating shaft applications. For reciprocating applications, centerless grinding is acceptable. Rotating shaft applications require a surface with no machine lead, as machine lead may actually pump fluid from under the seal lip. Also, hard chrome plating is suggested for any cast iron or stainless steel shafts for rotating applications and for steel shafts with reciprocating applications.

**A SHAFT CHAMFER** is suggested to assist in the installation process. Without a proper chamfer, the seal lip may be damaged or distorted resulting in a dislodged garter spring.

**SHAFT TOLERANCE** recommendations for general applications are listed below. The tolerance range should be decreased for high speed or pressure applications.

INCHES	
S.D.	D1
Up to 1.000"	S.D.-0.094
1.001 to 2.000	S.D.-0.140

150.01 to 175.00	S.D.-7.00

### Recommended Shaft Tolerance

SHAFT DIAMETER (INCH)	TOLERANCE	SHAFT DIAMETER (DIN/METRIC)	TOLERANCE
Up to 4.000"	±0.003	Up to 100mm	±0.08
4.001 to 6.000	±0.004	100.10 to 150.00	±0.10
6.001 to 10.000	±0.005	150.10 to 250.0	±0.13

## HOUSING RECOMMENDATIONS

### HOUSINGS

Steel and cast iron provide good surfaces for both rubber covered and metal O.D. seals. For soft alloy (aluminum) bores, rubber covered O.D. seals provide better sealing capability. In aluminum or other soft alloy bores, metal O.D. seals occasionally back out of the bore due to the thermal expansion of the soft alloy. Rubber, having a higher coefficient of thermal expansion than carbon steel, will tighten in the bores as temperature rises. Plastic or nylon are not recommended because they typically expand at a high rate causing a major problem for metal O.D. seals. If plastic is to be used, rubber O.D. seals are recommended.

### BORE CHAMFER

A bore chamfer is necessary to assist in installation of the seal. To the right is the recommended configuration for the chamfer.

Proper chamfer angle and depth minimizes cocking or lack of squareness of the seal to the shaft, distortion of the seal cases, and reduces assembly force.

### Recommended Bore Chamfer

### Surface Roughness

Excessively rough bore finishes may allow paths for fluid to leak between seal O.D. and bore. Below shows the recommended maximum roughness.

	METAL O.D.	RUBBER O.D.
MAXIMUM ROUGHNESS	100 $\mu$ inch Ra 2.50 $\mu$ M Ra	150 $\mu$ inch R <sub>a</sub> 3.75 $\mu$ M R <sub>a</sub>
	492 $\mu$ inch R <sub>max</sub> 12.5 $\mu$ M R <sub>max</sub>	

The rubber O.D. seal is capable of functioning with a rougher finish.

	METAL O.D.	RUBBER O.D.
MINIMUM ROUGHNESS	none	60 $\mu$ inch R <sub>a</sub> 1.5 $\mu$ inch R <sub>a</sub>

A minimum bore roughness is recommended for rubber O.D. seals. This improves retention.

## BORE RECOMMENDATIONS

### BORE DIAMETER TOLERANCE

The recommended housing bore diameter, bore tolerance and nominal pressfit.

## PRESSURE SEALS - JM CLIPPER

JM Clipper Corporation

# SHAFT SEALS FOR PRESSURE SERVICE

## *Don't let the pressure get you down!*

Excessive wear and heat build-up at the lip of shaft-seals is frequently caused by internal pressure. Whether this pressure is intentional or not, JM CLIPPER may have a solution that can allow you to avoid expensive equipment design or fixes — shaft-seals offering the special pressure performance you need, at the lowest cost!

HP SEAL

MP SEAL

If it's high pressure you're dealing with ( to 300 psi), you can look to our HP SEAL which has been solving problems for years. It's built tough with a fluoroelastomer sealing element, a strong metal case and a large, pressure activated, PTFE anti-friction element. It has an impressive pressure times velocity factor of 300,000, and can be used in a broad range of equipment, in rotary or reciprocating motion, at a cost less than many alternatives.

On the other hand, if pressure is in a more moderate range (to 100 psi), our MP SEAL gives you an even less costly solution. It has a pressure times velocity factor of 100,000, so it can operate in many different rotary applications. A rugged seal, it incorporates an elastomer covered metal shell for better O.D. sealing in the bore. The standard MP SEAL is offered in a special fluoroelastomer compound. Other materials are available at no premium. Years of experience with the MP SEAL have led to technical improvements that make today's MP SEAL a great design alternative.

INCH SIZE  
SHAFT SEALS

SPECIFICATION DATA		HP	MP
<b>Recommended Tolerances, Finishes, Design, and Installation Specifics</b>			
Minimum Bore & Shaft Entrance Chamfers		30° x 1/32"	30° x 1/32"
Shaft Hardness		30 Rockwell C. minimum 50 Rockwell C. maximum	30 Rockwell C. minimum 50 Rockwell C. maximum
Shaft Tolerance		± .001"	± .002"
Shaft Finish		10-20 RMS	10-20 RMS
Shaft Speeds <i>PV = Pressure (psi) x velocity (FPM)</i>		to 4000 FPM (max.) limited to 300,000 'PV'	to 4000 FPM (max.) limited to 100,000 'PV'
Bore Tolerance	Up to 3"	+ .001"	+ .0015"
	3.001 and above	± .002"	± .002"
Bore Finish		15-60 RMS	15-60 RMS
Cavity Depth		± .015" (must be a minimum 1/16" deeper than seal width)	± .015" (must be a minimum 1/16" deeper than seal width)
Shaft-to-Bore Misalignment	T.I.R. maximum	.003"	.005"
Shaft Runout	T.I.R. maximum	.003"	.005"
Fluid Service Temperature		-40°F to +400°F	-40°F to +400°F
Fluid Pressure		0 to 300 psi (limited to 300,000 'PV')	0 to 100 psi (limited to 100,000 'PV')
		Use Snap Ring or Backup Plate for Pressures over 50 psi.	Use Snap Ring or Backup Plate for Pressures over 20 psi.

### SIZES

JM CLIPPER HP Seals can be furnished for shaft diameters 1/2" through 8" in equal flange and widths 1/4" through 1 1/8". Maximum O.D. is 9.250". MP seals can be furnished from a shaft diameter of 1/2" to a maximum O.D. of 14.500". Smaller or larger sizes by special request.

### INSTALLATION

Both the HP and the MP seal can be installed in the conventional oil seal cavity with standard metal shell installation tools. Both can also be readily installed reversed in detached cavity holders which are separately mounted to the equipment body. Special bore dimensions are required. Contact your JM CLIPPER representative for more information.

The physical (or chemical) properties of JM CLIPPER Seals represent typical, average values obtained in accordance with accepted test methods and are subject to normal manufacturing variations. They are supplied as a technical service and subject to change without notice. Check with our factory to assure current information.

## PRESSURE SEALS - NOK

INCH SIZE  
SHAFT SEALS

### TB4

NOK Metal OD, Two stepped Main Lip Oil Seal with Auxiliary Dust Lip

Severe reciprocating shaft applications can be effectively sealed by the "T4" design. Pressure up to 100 psi (7kg/cm<sup>2</sup>) can be sealed, such as in shock absorbers.

### TC4

NOK Rubber OD, Double Lip, Two Stepped Main Lip Oil Seal

Severe reciprocating shaft applications can be effectively sealed by the "T4" design. Pressure up to 100 psi (7kg/cm<sup>2</sup>) can be sealed, such as in shock absorbers.

### TCN

NOK Rubber OD, Double Lip, Pressure Seal

Type "TCN" is designed for high pressure applications where continuous pressure may reach 150 psi (10.6kg/cm<sup>2</sup>). Maximum pressure limit is dependent on shaft speed.

### TCV

NOK Rubber OD, Double Lip, Pressure Seal

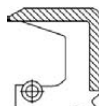

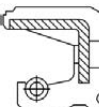

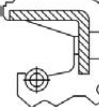

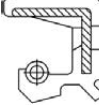

Type "TCV" is designed for high pressure applications where continuous pressure may reach 50 psi (10.6kg/cm<sup>2</sup>). Maximum pressure limit is dependent on shaft speed.

## SHAFT SEAL REFERENCE - JAMES WALKER

INCH SIZE  
SHAFT SEALS

Walkersele D6 & D7

### Walkersele™ Rotary Shaft Lip Seals Offering High Performance and ISO 9002 Certification

**D6** The most popular of the radial lip seals. The standard design is suitable for most applications, especially for sealing oil and grease lubricated bearings. The main features include:

- lip geometry which is designed to minimize heat generation and shaft wear
- optimum spring position which ensures uniform contact of lip on shaft
- flexible lip profile accommodates misalignment or shaft eccentricity.
- special high performance elastomers available, including fluoroelastomers (FKM) and HNBR.

Split seals available. Sizes available from 3/8" (10mm) shaft diameters upwards, with no maximum limit.

**D7** The D7 design forms a new part of the Walkersele range of lip seals for rotating shafts. It has a unique profile which has been developed to suit pressure applications. The main features include:

- costly profiled lip support plates not required.
- lip profile maintains shaft contact under conditions of misalignment or shaft eccentricity
- suitable for operating pressure up to 60 psi higher in some cases.
- full range of materials available, including special high performance elastomers such as fluoroelastomers (FKM or FKM) and HNBR
- extensive range of molded sizes available, from 1 1/4" (30mm) shaft diameters upwards, with no maximum limit.

**SURFACE RUBBING SPEED** The seal material should be selected to suit the shaft surface speed. Standard nitrile based materials are suitable for application speeds for D6 - 3600 ft/min (18 m/s); D7 - 2000 ft/min (10 m/s). Alternative materials should be considered for higher speeds, including fluoroelastomers which have been successfully used at speeds in excess of 5000 ft/min (25 m/s), and Elastolion HNBR.

**PRESSURE** Walkersele D6 design is not intended as a pressure seal. However, it can be used in conjunction with lip support rings for pressures up to 30 psi (2 bar). Machining details can be supplied on request. Where pressure is higher, the D7 design with pressures up to 60 psi (4 bar) should be used.

**TEMPERATURE** Nitrile rubber seals can be used for applications where the under-lip temperature does not exceed 240°F (120°C). For higher temperatures, alternative materials should be considered. Even with good lubrication and high heat dissipation, the lip temperature will be higher than the environmental temperature. Care should be exercised at temperatures above 180°F (80°C).

### Materials, Design and Construction

The following table outlines the range of materials most commonly used • Not all maximums can be combined at the same time.

Reference	Materials	Max. # Temp °F	Max. Speed - ft/min.		General Remarks
M1	Nitrile (NBR)	240	D6 3000	D7 2400	Our standard material suitable for most applications. A flexible rubberized fabric back and rubber lip. Cover plate required.
M6	Nitrile (NBR)	240	2400	2000	Incorporates an encapsulated steel band in the seal back. A self retaining seal suitable for housings without cover plates.
M8	Fluoroelastomer (FKM or FKM)	400	4000	3600	
M9	Fluoroelastomer (FKM or FKM)	400	5000	4400	As M1, but for higher speed applications. Cover plate required.
Elast-O-Lion®	Hydrogenated Nitrile (HNBR)	350	3000	2400	High strength elastomer suitable for more aggressive applications including those where additional wear and abrasion resistance is required.
Fluonion®	PTFE	500	600	consult	Right plastic material used for chemical and food processing applications.

## SHAFT SEAL REFERENCE - JAMES WALKER

INCH SIZE  
SHAFT SEALS

### D6 and D7 Seals are Available to Suit Two Types of Housing

#### Retained Seals

D6

D7

These seals must be used in housings fitted with cover plates. Our standard material seals should be fitted in this way. Such seals can be supplied in split form.

#### Self-Retaining Seals

D6

D7

The D6 & D7 seals may be fitted without retaining plates, but the D7 style must be fully supported, as shown, to contain pressure.

### Ease of Fitting

Ease of installation is a prime consideration for all Walkersele products. Unlike rigid metal backed seals, the total flexibility of the Walkersele allows for easy fitting and removal. To reduce fitting time, retained seals can be supplied in split form (The split D7 is not intended for pressure applications. We suggest the Walkersele OSJ (on-site join) to ensure endless seal integrity.) A solid rubber portion is included in the seal back through which the split is made. The close mating of the ends ensures that a potential leakage path is closed.

### Seal Lubrication for D6

When two or more seals are fitted in the same housing and interseal lubrication is required, access ports, and, where necessary, an annular groove can be incorporated into the seal base. Seals featuring this design modification are available on request.

### Recommended Housing For New Designs

**D6** For guidance purposes our recommended housing sizes for given shaft diameters are:

SELF RETAINING SEALS (M2, M5 & M8)					
Shaft Dia 'A'		Nominal Housing Sizes			
		Depth 'C'		Section 'D'	
mm	inch	mm	inch	mm	inch
up to 62.5	up to 2 1/2	10	3/8	10	3/8
over 62.5 to 100	over 2 1/2 to 4	12.5	1/2	12.5	1/2
over 100 to 250	over 4 to 10	15	5/8	15	5/8
over 250 to 400	over 10 to 16	20	3/4	20	3/4
over 400 to 600	over 16 to 24	22	7/8	22	7/8
over 600 to 900	over 24 to 35 1/2	25	1	25	1

\*Standard seals to charts 104, 105 and 375 will not necessarily conform to these recommendations please see dimensions shown on pages 8 and 9.

SEALS WITH RETAINING PLATE					
Shaft Dia 'A'		Nominal Housing Sizes			
		Depth 'C'		Section 'D'	
mm	inch	mm	inch	mm	inch
up to 35	up to 1 3/8	10	3/8	11	7/16
over 35 to 62.5	over 1 3/8 to 2 1/4	11	7/16	12.5	1/2
over 62.5 to 100	over 2 1/4 to 4	12.5	1/2	16	5/8
over 100 to 250	over 4 to 10	16	5/8	20	3/4
over 250 to 400	over 10 to 16	20	3/4	22	7/8
over 400 to 600	over 16 to 24	22	7/8	25	1
over 600	over 24	25	1	32	1 1/4

### D7

SEALS WITH RETAINING PLATE

## SHAFT SEAL REFERENCE - JAMES WALKER

### Ease of Fitting

Ease of fitting is a prime consideration for all Walkersels products. Unlike rigid metal backed seals, the total flexibility of the Walkersel allows for easy fitting and removal. To reduce fitting time, retained seals can be fitted in split form; however, as the D7 design is intended for pressure applications, we recommend the use of Walkersel OSJ (on-site join) so as to ensure endless seal integrity. A separate brochure is available describing this product.

## SHAFT SEAL REFERENCE - JAMES WALKER

INCH SIZE  
SHAFT SEALS

Walkersele D6 & D7

### Using Walkerseles as Ram/Rod Wipers

Walkerseles in split or solid form are frequently used as wipers or scrapers to prevent contamination or foreign particles from entering a hydraulic system. In such cases we recommend the LR6364/D5 design, on all rubber/fabric products with a springless lip. This combination will wipe a reciprocating ram clean without harming the surface or allowing the lip to fold back.

The recommended cross-section and height dimensions are the same as for D6 Walkerseles. However, for existing housings, most cross sections can be supplied with heights varying as required. In a number of cases, a single D5 Walkersele has replaced two competitor's seals with equal or better performance.

## SHAFT SEAL REFERENCE - JM CLIPPER

# EXPERIENCE, EXPERTISE, SOLUTIONS

JM Clipper is a world leader in formulating highly-effective solutions to sealing problems throughout industry. Few companies can match JM Clipper's expertise and experience in developing products for OEM and plant applications. Clipper Oil Seals are used in a wide range of equipment from pumps and gear boxes to construction and mining machinery to industrial equipment. These highly-effective seals are also used in plants in virtually every industry including primary metals, pulp and paper, chemicals and petrochemical, power generation, and more.

### Solving Problems High Over the Pacific

The JM Clipper name began in the 1990s with the development of the Clipper Oil Seal to control engine oil leaks on Pan Am Clipper aircraft flying the Pacific. As a division of Johns Manville until 1989, JM Clipper's history goes back to the 1800s. Today, JM Clipper brings sealing solutions to 500 OEMs and thousands of industrial plants through its own dedicated sales force and 2,000 independent distributors.

*A world leader in formulating highly-effective solutions to sealing problems*

### Non-Metallic Clipper Oil Seals

JM Clipper's proprietary design is based on a rubber/fiber outer case and elastomeric inner lip integrally molded to form a leak-free bond. A stainless steel garter spring provides the correct interference with the rotating shaft for an effective seal. Clipper Oil Seals are available in over 10,000 styles and sizes in a variety of compounds including fluoroelastomers.

### Specialized Radial Seals

In addition to standard Clipper Oil Seals, JM Clipper pioneered factory-split oil seals for fast, easy in-plant installation with no special tools or equipment modification. JM Clipper H/P and MP seals combine elastomers and metal shells for superior O.D. sealing and performance in high and medium pressure applications. SlipTite™ high performance seals handle shaft speeds up to 5,000 fpm. For sealing performance beyond radial lip seals, JM Clipper developed ProTech™, a new kind of PTFE labyrinth seal.

### ISO-9001 Certification

In 1994, Det Norske Veritas Industries of the Netherlands completed its ISO audit and JM Clipper gained ISO 9001 certification for manufacturing, product design, and engineering which adds yet a higher level of quality assurance.

### Non-Metallic Advantages

The unique non-metallic construction of Clipper Oil Seals offers important benefits over metal-cased seals before installation, during installation, and throughout the life of the seal.

#### Clipper Characteristics

Aramid fiber-reinforced composite

Integrally molded unit

Stainless steel garter spring

Specially-formulated elastomer lip with designed flexibility

#### Advantages

- Fits a wider range of bore tolerances and finishes, resulting in lower machining costs and easier installation
- Resists corrosion
- Takes more abuse, eliminating damage
- Gives better I.D. to O.D. concentricity resulting in less potential leakage and shaft wear
- Provides more uniform lip load
- Resists corrosion
- Minimizes friction resulting in less shaft wear
- Follows shaft eccentricity

### Comparison of Non-Metallic and Metal-Cased Seals

Key Benefits	Non-Metallic Clipper Oil Seals	Metal-Cased Seals
Corrosion Resistance	Yes	No
Positive O.D. Sealability	Yes	No
Durability and Damage Resistance	Yes	No
Easy Installation with No Special Skills or Tools	Yes	No
Built In Interference	Yes	Yes
Sizes to Fit Most Industrial Applications	Yes	Yes
Wearability/Long Life	Yes	Yes
Split Styles without Cover Plate	Yes	No

# SPECIAL DESIGN SEALS

INCH SIZE  
SHAFT SEALS

Cross Section	Description
	<p>The Type FL low cost general purpose seal is designed for rotary and reciprocating service. The all rubber lip element is integrally formed into its sealing position and self gasketed within the closed shell assembly to eliminate inner case leakage. The formed metal contour under the lip provides stability to the lip.</p>
	<p>The SlipTite (Teflon®/Rubber) seal was specifically developed for severe service. It has a single lip element that combines the low friction properties of Teflon with the flexibility and durability of rubber. It is sealed into an outer metal case and engineered for intermittent pressure service up to 10 psi.</p> <p><small>*Registered DuPont trademark</small></p>
	<p>The TMA-L and TMA-S seals are designed specifically for special corrosive chemical service. The Stainless Steel outer case contains a machined Teflon seal insert with or without a spring activated lip.</p>
	<p>The Type HP high pressure seal is a sophisticated design to handle rotary and/or reciprocating motion at high speeds and pressures over a temperature range of (-40°F to +400°F). Pressures up to 300 psi and 4,000 DPM can be handled.</p>
	<p>The Type MP medium pressure seal is designed to handle rotary applications up to 100 psi and temperatures from -40°F to 400°F. The inner metal shell is encapsulated in fluoroelastomer.</p>
	<p>The Clipper SlipTite is a specially designed seal that utilizes a layer of PTFE molded to the sealing lip to reduce excessive wearing on the shaft. It can handle pressure applications up to 40 psi and higher temperatures up to 350°F. The Clipper SlipTite can be utilized in applications with limited lubrication. LUP, RUP, SS, SSW, HP &amp; MP designs can be produced.</p>
	<p>JM Clipper Extruded seals are available in both single and dual lip types where installation of solid or rigid seals becomes difficult or impossible due to size or location.</p>
	<p>The JM Clipper positive lip contact sheave seal provides excellent foreign matter exclusion properties while retaining bearing lubricant. These seals are used on wire rope sheaves found in overhead cranes in the steel mills; on rotary drilling rig crown and travel blocks; and on draglines, hoists and elevators. They also have application on mine car wheels, flywheels and idler wheels.</p>
6	<p>Other specialty seals can be custom designed to meet your specific equipment requirements.</p>

# WORLD CLASS TECHNOLOGIES AND MANUFACTURING

JM Clipper meets customers' sealing needs with a wide range of new and proven technologies including unique rubber/fiber composites, traditional rubber and textiles, PTFE, and flexible graphite. These materials are all utilized at the company's 305,000 square foot facility in Naengdoches, Texas. For more information about JM Clipper products and services visit our website at [www.jmclipper.com](http://www.jmclipper.com).

Packing Division

### Rotary Shaft Seals

Product  
Bulletin

No. 5208B1-USA

### Rotary Shaft Seals/Oil Seals Now Available Through Packing Division's Global Business Unit

#### Excellent quality and competitively priced!

The quality of our products is excellent and you will be pleased with our competitive prices. Prototype costs are very affordable and our non-reoccurring set up charge (N.R.S.U.C.) for production parts is minimal to nonexistent.

#### The seal of choice for rotating shafts

Rotary Shaft Seals/Oil Seals are one of the most popular dynamic seals in the sealing industry today. Commonly used in a wide variety of pumps and motors, Rotary Shaft Seals are an excellent choice for sealing high speed rotating shafts and low pressure lubricants. Just about anywhere a bearing is used to support a rotating shaft, you will find a Rotating Shaft Seal installed to keep lubricating fluids in the system and contamination out.

#### Parker offers a wide variety of seal styles

There are literally hundreds of different styles. Most are variations of the standard configuration utilizing a rubber sealing lip to lightly contact a rotating shaft and a metal case to press it into a stationary housing. Depending on the application, Rotary Shaft Seals can be supplied with or without a metal spring, a secondary wiping lip or auxiliary devices. The sealing lip can be bonded to a bare metal case or the case can be supplied covered with rubber. Elastomer blends in Nitrile, Silicone, Fluorocarbon, and Polyacrylate are available along with carbon steel or stainless steel metal springs and cases.

#### We can supply the right type of seal

Rotary Shaft Seals can be supplied to the customer's exact design specifications or Parker Packing Division's Global Business Unit can assist you in selecting the appropriate style. To retrofit existing applications Rotary Shaft Seals can be produced based on customer's prints, samples, or by cross-referencing the previous supplier's part number.

#### Quality products from start to finish

Through the Global Business Unit Parker Packing Division supplies its customers with only the highest quality Rotary Shaft Seals. Packing Division Quality Audits ensure production of high quality products from modern, reliable computer controlled equipment. The following steps outline the typical process used to manufacture our Rotary Shaft Seals:

- Detailed product specifications are established utilizing CAD software.
- Tools are manufactured utilizing CAM software and modern CNC equipment.
- Machined cavity molds are inspected, heat-treated and ground precisely to close tolerance specifications.
- Finished tools are inspected by precision instruments.
- Seals are molded using vacuum type hydraulic vulcanization machines.
- Seals are precisely knife trimmed to produce a clean, sharp sealing lip.
- Finished products are inspected at the site of manufacture and again at the Packing Division prior to shipment.

## SHAFT SEAL REFERENCE - PARKER

### Nomenclature

Refer to the nomenclature below to assist you in detailing your Rotary Shaft Seal design specifications.

**Warning:** Failure, improper selection or improper use of the products and/or systems described herein or related items can cause death, personal injury or property damage. This document and other information from Parker Hannifin Corporation, its subsidiaries and authorized distributors provide product and/or system options for further investigation by users having technical expertise. It is important that you analyze all aspects of your application and review the information concerning the product or system in the current product catalog. Due to the variety of operating conditions and applications for these products or systems, the user, through his own analysis and testing is solely responsible for making the final selection of the products and systems and assuring that all performance, safety and warning requirements of the application are met.

## SHAFT SEAL REFERENCE - PIONEER WESTON

INCH SIZE  
SHAFT SEALS

### ① SOLID BODY P.T.F.E SEALS

'Flexibility' is the key word associated with Pioneer Weston's solid bodied P.T.F.E seals, commonly known as R60's.

You name the size, we make the seal, that is as flexible as you can get!

The solid body P.T.F.E lip seal is a two piece construction, consisting of an outer case (solid body) which is machined, not pressed. Also a blended P.T.F.E sealing element which together provide a simple radial lip seal, capable of satisfying a wide range of working conditions.

High temperatures, shaft speeds, pressures, and resistance to chemical attack can be catered for, and because of the simple construction, low volumes, odd sizes, and short delivery times are no problem.

### ② P.T.F.E RANGE OF SEALS

The seal consists of a thin membrane of P.T.F.E, secured between two metal shells and a rubber gasket.

Various hybrid designs of this standard are available to suit the application, including FDA grade material. An important feature of P.T.F.E seals is the uni-directional hydrodynamic pattern which prevents any tendency for leakage, and extends the life of the seal considerably. Low friction, and low heat generation are a vital feature of this seal; which is now being utilised heavily in the automotive, and specialist industrial sectors.

Their emphasis of course being durability, and reliability.

## SHAFT SEAL REFERENCE - PIONEER WESTON

### STANDARD, ROTARY SHAFT SEALS

3

Along with our vast technical experience goes our extensive range of standard rotary shaft seals.

The range is covered by four basic designs, designated, R4, R6, R21 and R23. The R4, is a metal cased single lip seal with a spring assisted lip. The R6 is similar, but with an additional dust lip to prevent the ingress of external dirt, water etc, into the sealed medium.

Both the R21 and R23 seals are 'rubber covered' versions of the R4 and R6 respectively.

This standard range of seals is suitable for use in the majority of medium range applications. Most seals in this range use NBR rubber as standard, but other compounds and variations are available, dependent on the application.

### TX SPLIT SEALS

4

Losing production? Regular weekend working? Downtime costing a fortune in lost man hours?

These questions are simply answered, look no further than Pioneer Weston's split radial lip seal, TX Series.

Cut your replacement time to a minimum, and your downtime to minutes.

This seal performs all the functions of a standard radial lip seal but also

has all the benefits which attract the maintenance and design engineers, the seal components are split.

Costs are kept to a minimum by quick and easy replacement of seal parts, no need to disconnect couplings or remove pulleys and driving keys, simply remove split clamp plates and worn seal, refit new elastomer and clamp plates.

### 5 AXLE SEAL RANGE

Trucks, Trailers, Tractors...

All these have one thing in common Pioneer Weston supply a wide and varied selection of AXLE Seals to these industries.

Most of the designs are of the unitised type, which means they incorporate a built-in running surface which eliminates a costly shaft surface finishing operation for the customer. All the seals in this range are available in a variety of rubber compounds, materials, and styles to suit your application needs, and our expert design team, and their computer aided skills are always on hand to identify the correct sealing solution.

### IMPAX MECHANICAL SEAL RANGE

6

For many years engineers have been using the mechanical seal principle for solving difficult sealing problems.

Pioneer Weston's vast experience of specific applications, coupled with an energetic development programme has contributed highly to our success in this field. Sound engineering, and a problem solving approach, have made Pioneer Weston the real innovators in mechanical sealing, with an industrial range as diverse as confectionery to coal mining!

The IMPAX balanced pressure seal is specifically designed to meet the need to accommodate high rotational speeds, fluid temperatures and pressures.

The seals are easily stripped into their component form for inspection, and a full spares and refurbishment service is available.

INCH SIZE  
SHAFT SEALS

7

### NON STANDARD SEALS AND SOLUTIONS

These are the seals that go beyond the call of duty, seals that are particularly prominent in the more aggressive conditions. Typically found in offroad vehicles, site excavators, and agricultural equipment. Basically the applications that turn designers 'grey' overnight!

The seals are mainly of special purpose design, often using alternative and exotic compounds and materials to suit the application. The emphasis is on the exclusion of external contaminants, such as sand, mud and grits. They are also of use in the food industry where mixing processes often include abrasive ingredients, such as sugar, etc.

The use of designed-in high performance materials gives a high success rate against premature sealing lip failure, and high service costs.

### MOULDED PRODUCTS

8

With over 60 years of rubber moulding and technology experience, we can manufacture a variety of all rubber or bonded rubber products.

Typical items include bushes, plugs, bungs, covers, specialist gaskets, and allied rubber products, etc.

The list is as large as you the customer, wishes it to evolve, we will be more than happy to offer suggested solutions to your particular problem.

SHAFT SEALS

## V-RINGS

The V-ring is an axial face seal made of pure elastomer without reinforced fabric or metal. The V-ring is suitable for use as a single seal against dirt, dust, water, grease or oil. The sealing lip slides on a mating surface at right-angles to the shaft. The ring rotates with the shaft. The five different profile types A, E, L, S, and RM are available for the many possible applications. The E and RM types are designed mainly for use in heavy machinery. The RM V-ring has a groove on the outer periphery for accepting a clamping strip.

The sealing lip runs on a mating surface positioned vertically with respect to the shaft. The ring runs together with the shaft.

The V-ring provides a reliable seal when the shaft is both tilted and eccentric to its axis.

Standard materials are nitrile rubber (NBR) resistant to mineral oil-based media and fluorinated rubber for high temperatures and aggressive media. V-rings can also be made of other materials on request.

Application limits		
Pressure	0.3 bar	4.35 PSI
Temperature		
NBR	-40...+100°C	-40...+212°F
FPM	-23...+150°C	-9.4...+302°F

Surface finish		
Surface roughness	$R_a$	$R_t$
Sliding surface	$\geq 2.5 \mu\text{m}$	$\geq 12 \mu\text{m}$

No special machining is required since the V-ring adheres firmly to the shaft.

### TYPE A

The most common style available in the widest range of sizes from 0.110" shaft to 79.530" nitrile and fluoroelastomer. Ideal for conveyor rollers and appliances.

### TYPE L

Very narrow axial cross-section commonly used in pillow blocks to enhance or replace labyrinth seals. Available in nitrile and fluoroelastomer for shaft sizes from 4.134" shaft to 24.800", also available up to 79.724".

### TYPE S

The original V-ring designed with a wide body and tapered heel to firmly hold the ring on the shaft. Available in sizes from 0.180" shaft to 8.270". Commonly use in agricultural and automotive applications.

### TYPE E

The heavy duty large-diameter style commonly used in rolling mills as a dirt/water excluder seal. Available in both nitrile and fluoroelastomer for shaft sizes from 12.000" to 79.130".

### TYPE RM

A heavy duty large-diameter style designed to operate in severe running conditions. The unique body can accommodate radial and axial support in high shaft speed applications. This V-ring can be trimmed to meet existing space requirements, (with a minimum fitted width of 1.670"). Available in sizes from 12.000" shaft to 118.000" in nitrile only. The RM is a made-to-order item.

## JD PROFILE - FLANGED ROTARY SEAL

### Applications:

- Best choice for sealing rotating shafts, such as pumps, motors and rotary actuators.
- Suitable for pressures to 3000 psi, 21 MPa.

### Features:

- O.D. flange stabilizes seal, prevents seal rotation and resists thermally induced movement.
- Heavy I.D. seal-lip ensures longest life.
- Dual retained spring-energizer for maximum security.
- Low load high-compliance spring energizer.
- Many high-resilience spring-energizer-options, including choice of light, medium and heavy loads (for friction control) and "NACE" corrosion resistance for oil field use.
- Available with silicone-filled cavity for food and drug applications.

### Cross Section

Where space permits, use of the largest cross section seal is preferred. If specifying a diameter which is above the recommended diameter range, use the largest recommended diameter for the appropriate cross section to determine the cavity tolerances.

### Compound selection

Sealing surface	Medium	POLON® PTFE compound
Steel	Hydraulic oils, Mineral oils, Lubrication oils	POLON® 031, 012, 052
Steel chromium plated	Water/oil emulsions, Hot water and steam	POLON® 031, 074
Cast iron	Unlubricated and lubricated air, Fire resistant fluids, Phosphate ester	POLON® 031, 012, 074
Stainless Steel	Unlubricated and lubricated air, Fire resistant fluids, Phosphate ester	POLON® 301,074
Aluminium hard soft	all above listed	POLON® 031 POLON® 044, 067

### Compound specifications

Reference	Compound	Colour	Temp. (°F)		Application	Characteristics
			min.	max.		
POLON® 012	Modified PTFE	dark green	-310	+446	Low-duty hydraulic applications	Improved wear resistance
POLON® 031	PTFE +15% carbon	black	-310	+554	Medium mechanical stress Hard sealing surfaces water/oil emulsions	Chemical resistance limited by carbon
POLON® 044	PTFE +15% graphite	black	-310	+446	Low mechanical stress Soft sealing surfaces	Chemical resistance limited graphite
POLON® 052	PTFE +40% bronze	bronze	-248	+500	Heavy mechanical stress Hydraulic applications	Outstanding wear and creep resistance
POLON® 067	PTFE +10% ekonol	beige	-436	+608	Medium mechanical stress Soft sealing surfaces Rotary sealing	Limited chemical resistance Limited use in hot water
POLON® 074	PTFE +10% carbon fibre	greyish	-436	+590	Water hydraulics Seawater Short strokes with high frequency	Very good wear properties in water

## Rotary Shaft seals - types, dimensions, applications DIN3760

The use of rotary shaft seals according to Din 3760, October 1962 edition, which is no longer valid, is to be agreed upon.

Dimensions in millimeters

### 1. Scope

This standard applies to rotary shaft seals for sealing rotating shafts and spaces with negligible differences in pressure (see also section 5.1.2).

### 2. Dimensions and Designation

The shaft seals need not to conform to the illustration: only the specified dimensions must be adhered to.

Type A

Fig. 1

Type AS

with protective lip, remaining dimensions and details as Type A

Fig. 2

Designation of a Type A shaft seal (SS) for shaft diameter  $d_1 = 25\text{mm}$ , by  $d_2 = 40\text{mm}$  external diameter and  $b = 7\text{mm}$  breadth, elastomer part made of nitrile butadiene rubber (NB):

Shaft seal	A 25 x 40 x 7 DIN 3760 - NB
or SS	A 25 x 40 x 7 DIN 3750 - NB

If marking with material indicating letters is required (see section 4.2), the letter G is to be appended with a hyphen placed before it.

The extended designation the reads e.g.:

SS	A 25 x 40 x 7 DIN 3760 - NB - G
----	---------------------------------

## Rotary Shaft seals - types, dimensions, applications **DIN3760**

Table 2. Press fit allowance and permissible circularity error of the  $d_2$  external diameter.

external diameter $d_2$	press fit allowance	permissible circularity error
up to 50	+ 0,3 + 0,15	0,25
over 50 to 80	+ 0,35 + 0,2	0,35
over 80 to 120	+ 0,35 + 0,2	0,5
over 120 to 180	+ 0,45 + 0,25	0,65
over 180 to 300	+ 0,45 + 0,25	0,8
over 300 to 500	+ 0,55 + 0,3	1

The  $d_2$  external diameter is to be measured at two points which are offset by 90°; the mean value of both measurements is relevant, whereby the values specified for the permissible circularity error may not be exceeded. Concentricity tolerance according to DIN 7184, sheet 1 (at present still in draft) cannot be used as the SS cannot be included on the reference axis during testing.

### 3. Materials and surface protection

Materials for stiffening ring and spring, as well as surface protection of these parts, is selected by the manufacturer. If sealing is required against media which corrode steel, the question of rust protection for the stiffening ring, as well as the material to be used for the spring must be clarified with the manufacturer.

Material for elastomer part:

Material indicating letters	Elastomer base
NB	Nitrile butadiene rubber
AC	Acrylate rubber
SI	Silicone rubber
FP	Fluoride rubber

The choice of elastomer base suitable for the intended use is determined by the media to be sealed, its permissible constant temperature and the peripheral speed of the shaft (see Table 4 and Fig. 3). In case the application conditions specified in this standard are being exceeded the manufacturer is to be consulted.

### 4. Marking

#### 4.1. Type and size marking

Shaft seals corresponding to the stipulations of this standard, provides sizes permit, are to be permanently marked by: type letters, dimensions, DIN and manufacturer's symbol.

#### 4.2. Marking of elastomer part material

The original packing of shaft seals is always to be marked with the material indicating letter of the elastomer part.

If specially ordered (see section 2) the elastomer part material must be specially marked at a suitable point on the shaft seal.

Following versions of this marking, as selected by the manufacturer. are permissible:

- the material indicating letter for the elastomer part is vulcanized into a surface suitable for this purpose. or
- the elastomer part material is marked with a permanent, mineral oil and grease resistant colour on the rotary shaft seal, or
- given by means of similarly coloured labels.

Following colours apply for b) and c):

for	NB;	white	RAL9002*
	AC:	yellow	RAL1012*
	SI:	blue	RAL5009*
	FP:	red	RAL3000*

### 5. Application

#### Type A rotary shaft seals:

With the elastomer outer covering a close and tight fit in the holding bore hole can be expected in the complete range of temperature, even in the case of materials for housings with greater thermal expansion than steel. Further, damage of the holding bore hole is avoided by the elastomer covering.

#### Type AS rotary shaft seals

Through the protective lip, the AS type has the additional advantage that contaminations are kept away from the actual point sealed. If the space between the sealing lip and protective lip is packed with a suitable grease, wear on the sealing point is reduced and corrosion of the shaft is delayed. The compatibility of the grease with the elastomer base and media selected must be checked.

#### 5.1. Permissible rotational and peripheral speeds

##### 5.1.1. In the case of pressureless operation

Fig.3 shows which shaft speeds may normally be permitted in the case of pressureless operation related to the elastomer par material (amongst others a good lubricating mineral-oil with good lubrication access for the dispersion of heat).

\*)The RAL colours mentioned can be obtained as individual cards of the RAL 840 HR Colour Index from:  
Beuth-Vertrieb GmbH, Burggrafenstrasse, 1000 Berlin 30 and Friesenplatz 16, 5000 Köln 1

METRIC SIZE  
SHAFT SEALS

## Rotary Shaft seals - types, dimensions, applications DIN3760

5.1.2. In the case of operating with pressure admission Shaft seals must seal spaces with negligible differences in pressure (see Table 3) against fluids and greases and, as far as lubrication exists, against air. Table 3

pressure difference bar max.	Rotational shaft speed but peripheral speed at the same time	
	min <sup>-1</sup>	m/s max.
0,5	up to 1000	2,8
0,35	up to 2000	3,15
0,2	up to 3000	5,6

In the case of unfavourable sealing conditions, consultation between user and manufacturer is recommended.

5.2. Chemical and thermic durability of the elastomer part (Table 4).

The values shown in table 4 represent a guiding

principle, whereby the media are summarized in groups. The durability of elastomers against media which are not mentioned in table 4 is to be agreed upon between user and manufacturer.

If the constant permissible temperature for a group of media is given, the durability of the elastomer in this range is specified.

A ● means, that there are media within this group of media, which can be sealed by the elastomer concerned, but media are also known, which may impair the elastomer. In this case also, consultation between user and manufacturer is recommended.

A — means, that the elastomer is not resistant against this group of media.

The respective elastomer base is not yet destroyed at the low temperatures specified. the elastomer is fully reusable after rewarming.

## 6. Installation instructions

### 6.1. Generally

In addition to the following instructions, the manufacturer's fitting instructions are to be observed when installing shaft seals. In the case of shaft seals made of silicone elastomer, attention is to be paid to the limited toughness of the sealing lip.

The sealing lips must always face the side to be sealed and it must be guaranteed that they rest freely, i.e. they must not be jammed. Sealing lip contact surfaces must be smooth (see section 6.2.1.) and may not be damaged. Shaft seals must be installed centrally and vertically to the shaft; the use of a suitable mounting tool is recommended. Shaft

seals may not be distorted in axial direction and also not be used for the transmission of forces.

### 6.2. Shaft

The ISO tolerance-zone h 11 is to be stipulated for the  $d_1$  shaft diameter in the area of the contact surface (see Figs. 5 and 6).

The sealing lip must not be damaged during installation. The following is therefore recommended in the case of:

- installation in direction of shaft Z: rounding off of shaft by 0.6 or 1mm, see Fig. 3 or chamfering of shaft according to Table 5.
- installation in direction of shaft Y: chamfering of shaft according to Table 5.

<sup>3)</sup> SI only usable on access of atmospheric oxygen to the point sealed as, otherwise, destruction of the elastomer may occur.

**Table 5. Chamfering on the shaft**

20	17,7	48	44,5	78	73,6	145	138	300	289	—	—
22	19,6	50	46,4	80	75,5	150	143	320	309	—	—

**6.2.1. Surface finish of shaft**

In order to guarantee sealing between seal and shaft, the shaft must be machined to a surface roughness of from 1 to 4  $\mu\text{m}$  in the area of the contact surface. It is essential that this machining does not leave any rifling marks on the shaft which could lead to leakage due to their conveying action.

**6.2.2. Surface hardness of shaft**

The working life of the sealing point is dependent on the surface hardness of the contact surface on the shaft. Minimum hardness should be 45 HRC.

In the case of soiled agents or dirt from outside, as well as peripheral speeds in excess of 4 m/s, the minimum hardness should be 55 HRC.

A minimum hardening depth of 0.3 mm is required for surface hardness. When nitriding is carried out, the grey coating is to be polished.

**6.3. Contact surface**

The values given in sections 6.2.1 and 6.2.2 for surface finish and surface hardening are to be observed

Fig. 5

within the contact surface area quoted in Table 6.

Fig. 6

**Table 6.**

b	contact surface area at

12	5	10	2	12
15	6	12	3	15
20	9	16,5	3	19,5

**6.4. Receiving bore hole**

The ISO tolerance-zone h8 is to be stipulated for the  $d_2$  bore hole diameters with a maximum surface roughness of 16mm.

The bore hole is to be chamfered by approx. 5 to 10° according to Table 7. For correlation of b to  $d_2$  see Table 1 and Fig. 4.

10	8,5	10,3
12	10,3	12,3
15	12,75	15,3
20	17	20,3

### 6.5 Shape and position tolerances

#### 6.5.1. Coaxiality

Figure 7 shows coaxiality tolerances.

Fig. 7.

#### 6.5.2. Shaft concentricity tolerance

Shaft concentricity tolerance should be kept within narrow limits. This would be necessary because of the existing danger particularly at high speeds, that the sealing edge cannot follow the shaft, due to its inertia. If, due to the concentricity tolerance, the clearance between sealing edges and shaft is larger than is necessary for the maintenance of hydrodynamic lubrication the agent to be sealed escapes from the sealing point. It is, therefore, advisable to locate the shaft seal as close as possible to the bearing and to keep the bearing play as small as possible.

Figure 8 shows shaft concentricity tolerances.

Fig. 8.

### Explanatory notes

When DIN 3760 was published in October 1962, this standard could be regarded as a considerable improvement compared with the DIN Standards 6503 and 6504 which were already out-of-date at that time. In those days three types of construction

- A without metallic casing
- B with metallic casing
- C with metallic casing and cap

had been agreed upon and the breadth «b» fixed as small as possible in the dimension tables to minimize the space requirement. The material specifications were left open and had to be agreed upon when placing the order. A section concerning «application» already gave considerable instructions. In the meantime, the development in the field of rotary shaft seals has continued and sealing against further media's must be additionally undertaken. For this reason, the responsible working committee of the FNA on shaft seals has carried out a revision of seals which is now made public. The following is described:

#### Type of construction

The share of production of the previous construction type C has dropped considerably. This low level has not yet been achieved with construction type B. As these types of construction type A with elastomer, the Working Committee has deleted types B and C. Construction form AS with elastomer outer covering and protective lip has been additionally included, because it has, to an increasing degree, introduced itself into usage. The pro-

ductive lip has been accepted fixed flush with the breadth of the ring. In practice, a grooved surface for the  $d_2$  diameter has become known for the type of construction with elastomer out covering. This version may be pressed into the bore hole much easier and provides less resilience. However, other press fit allowances are necessary than specified in Table 2. This development is yet to be completed and, moreover, it cannot yet be assessed whether the smooth surfaces used so far can be generally replaced by a grooved one. For this reason a stipulation in this standard has been abstained from. As the shaping of the surface area is still open, nothing has been laid down concerning the measuring of the diameter and the contact pressure to be applied upon.

#### Table 1

To prevent false assumptions it has been stated that the  $d_1$  diameters specified refer to the diameter of the shaft.

A rotary shaft seal appropriately dimensioned is selected by the manufacturer. This proves necessary because the dimension of the elastomer sealing element is yet to be laid down and because the manufacturer must select the most favorable contact pressure corresponding to the October 1962 edition. Only 7 x 16, 8 x 16, 10 x 19 and 15 x 24 ring sizes have been omitted because they do not correspond to the ratio of the radial ring height

$$\frac{d_2 - d_1}{2} \geq 5\text{mm}$$

## Rotary Shaft seals - types, dimensions, applications **DIN3760**

### Materials

Taking into account the various media's which are to be sealed, four elastomer bases had to be included. These must be contained in the designation example when ordering. The letters selected indicating the material are supplementary means, only, to indicate the elastomer. It is left to the discretion of the individual manufacturers to select the respective recipe according to his own experience. However, the finished vulcanized shaft seal must satisfy the requirements of this standard.

### Marking

For obvious reasons, it is a consumer requirement that rotary shaft seals are marked: this arises in particular in the case of replacement, because it must be known which shaft seal is suitable. The marking of the material is, however, confronted with difficulties on the part of the manufacturer. To some extent it is customary to vulcanize several elastomer bases in the same mould. For this reason the Working Committee could not agree in principle to marking with letters indicating the material. If marking is required, this must be expressed when ordering.

The selection of letters indicating the material is in conformity with the previous regulations. However, the ISO Recommendation R 1629 which was published in March 1971, contained the following indicating letters:

NBR	in place of	NB
ACM	in place of	AC
MQ	in place of	SI
FPM	in place of	FP

As these new indicating letters have not as yet been taken over into a German basic standard, it was impossible to include them in this standard.

### Application

This section has been rearranged and extended. To start with, it provides information concerning both types of construction, A and AS.

### Figure 3

Figure 3 shows a summary of the peripheral speeds possible in case of specific shaft diameters related to the elastomer base, for the case of pressureless operation.

### Table 3

The previous edition of October 1962 just indicated that shaft seals for sealing rotating shafts are only to be applied in spaces with small differences in pressure (about 0.5 bar). Table 3 in the new edition gives

a more accurate definition, whereby the rational speed of the shaft is referred to in relationship to the peripheral speed.

Table 4. Chemical and thermal durability of the elastomer part

DIN 6503 and DIN 6504 refer to -30°C to +130°C continuous operation. On the other hand the October 1962 edition of DIN 3760 referred to -40°C to +110°C.

These specifications have not been valid for some time now because they must be regarded in relationship to a specific elastomer base. Table 4 and the explanatory preamble thereto now provides information concerning the relations and should be carefully considered in the application so that a maximum working life is achieved. Taking the reciprocal coordination of mechanical, thermal and chemical stresses into account, permanent temperatures higher than those specified in Table 4 may frequently be applied.

### Shaft surface

The sections «Surface Finish of Shaft» and «Surface Hardness of Shaft» show what is to be considered in order to achieve a good sealing action and adequate working life.

The surface finish of the shaft may be achieved by various manufacturing processes. For this reason, this section specifies the requirements, only. The «free of rifling» requirement arises in order to avoid the pumping effect at the sealing point. This surface finish can, for example, be achieved by plain rollers and also by grinding without axial feed of the grinding wheel (recessing process). To avoid the rifling effect the grinding wheels must also be retracted accordingly.

### Contact surface

Originally, the Working Committee tried to stipulate the clearance of the sealing lip up to the contact surface of the rotary shaft seal. As the development of shaft seals has not yet been completed, there are certain differences with the individual manufacturers. For this reason a contact surface area has been specified, within which surface finish and surface hardness must be observed.

### Tolerances in shape and position

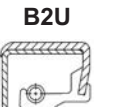

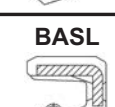

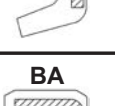

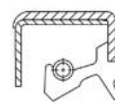

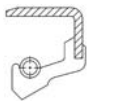

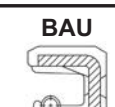

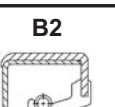

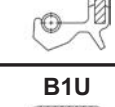

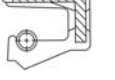

Diagrams have been fitted into the sections «Coaxiality» and «Concentricity Tolerance», in order to create a basis concerning the sizes permissible.

## PRESSURE SEALS - NOK

### TB4

NOK Metal OD, Two stepped Main Lip Oil Seal with Auxiliary Dust Lip

Severe reciprocating shaft applications can be effectively sealed by the "T4" design. Pressure up to 100 psi (7kg/cm<sup>2</sup>) can be sealed, such as in shock absorbers.

### TC4

NOK Rubber OD, Double Lip, Two Stepped Main Lip Oil Seal

Severe reciprocating shaft applications can be effectively sealed by the "T4" design. Pressure up to 100 psi (7kg/cm<sup>2</sup>) can be sealed, such as in shock absorbers.

### TCN

NOK Rubber OD, Double Lip, Pressure Seal

Type "TCN" is designed for high pressure applications where continuous pressure may reach 150 psi (10.6kg/cm<sup>2</sup>). Maximum pressure limit is dependent on shaft speed.

### TCV

NOK Rubber OD, Double Lip, Pressure Seal

Type "TCV" is designed for high pressure applications where continuous pressure may reach 50 psi (10.6kg/cm<sup>2</sup>). Maximum pressure limit is dependent on shaft speed.

## PRESSURE SEALS - SIMRIT

METRIC SIZE  
SHAFT SEALS

### **BABSL** SIMRIT Covered OD, Double lip, pressure oil seal

For sealing pressurized media without additional backup ring, e.g. for rotational pressure sealing in hydraulic pumps, hydraulic motors, hydrodynamic clutches. Rubber covered O.D. assures sealing in the housing bore, even where there is considerable surface roughness, thermal expansion or split housing. Particularly suitable for sealing low viscosity and gaseous media.

### **B2PT** SIMRIT Outer metal case, single PTFE sealing lip

For use in a range of special applications, particularly in general mechanical engineering and in the chemical industry; for high temperature requirements: dry running and poor lubrication; high chemical resistance; stick-slip free behavior; in extreme cases dynamic sealing behavior is partially limited.

### **BAD** SIMRIT Rubber OD

Older type for use in components with light pressure; now largely replaced by type BABSL.

### **B1D** SIMRIT Rubber OD

Older type for use in components with light pressure; now largely replaced by type BABSL.

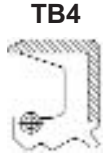

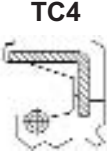

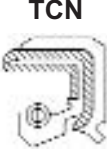

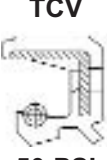

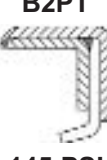

# simrit®

## V-RINGS

The V-ring is an axial face seal made of pure elastomer without reinforced fabric or metal. The V-ring is suitable for use as a single seal against dirt, dust, water, grease or oil. The sealing lip slides on a mating surface at right-angles to the shaft. The ring rotates with the shaft. The five different profile types A, E, L, S, and RM are available for the many possible applications. The E and RM types are designed mainly for use in heavy machinery. The RM V-ring has a groove on the outer periphery for accepting a clamping strip.

The sealing lip runs on a mating surface positioned vertically with respect to the shaft. The ring runs together with the shaft.

The V-ring provides a reliable seal when the shaft is both tilted and eccentric to its axis.

Standard materials are nitrile rubber (NBR) resistant to mineral oil-based media and fluorinated rubber for high temperatures and aggressive media. V-rings can also be made of other materials on request.

Application limits		
Pressure	0.3 bar	4.35 PSI
Temperature		
NBR	-40...+100°C	-40...+212°F
FPM	-23...+150°C	-9.4...+302°F

Surface finish		
Surface roughness	$R_a$	$R_t$
Sliding surface	$\geq 2.5 \mu\text{m}$	$\geq 12 \mu\text{m}$

No special machining is required since the V-ring adheres firmly to the shaft.

### TYPE A

The most common style available in the widest range of sizes from 2.7mm shaft to 2020mm nitrile and fluoroelastomer. Ideal for conveyor rollers and appliances.

### TYPE L

Very narrow axial cross-section commonly used in pillow blocks to enhance or replace labyrinth seals. Available in nitrile and fluoroelastomer for shaft sizes from 105mm shaft to 630mm, also available up to 2025mm.

### TYPE S

The original V-ring designed with a wide body and tapered heel to firmly hold the ring on the shaft. Available in sizes from 4.5mm shaft to 210mm. Commonly use in agricultural and automotive applications.

### TYPE E

The heavy duty large-diameter style commonly used in rolling mills as a dirt/water excluder seal. Available in both nitrile and fluoroelastomer for shaft sizes from 300mm to 2010mm.

### TYPE RM

A heavy duty large-diameter style designed to operate in severe running conditions. The unique body can accommodate radial and axial support in high shaft speed applications. This V-ring can be trimmed to meet existing space requirements, (with a minimum fitted width of 42.5mm). Available in sizes from 300mm shaft to 3000mm in nitrile only. The RM is a made-to-order item.

## V-RINGS - TYPE A

For added protection in extremely contaminated applications, we also offer the type VRM01. The VRM01 seal also seals axially and functions by combining positive lip contact with centrifugal "slinging" action. However, the VRM01 seal is different in that the rubber element is stretch fitted into a metal shell. The metal shell is then press-fitted onto the shaft. This shell provides excellent protection from heavy debris and it automatically accommodates high rotating speeds without auxiliary clamping devices.

#### Advantages/User Benefits:

- The metal shell serves as a support and deflector the rubber body and lip are protected from damage and displacement by external debris (i.e. rocks, viscous media)
- In most cases, the shell also functions as a holder that keeps the rubber lip in position during high surface speeds. No additional axial retention is required.

- Due to its compact design, narrow installation widths are possible.
- Frictional heat build-up and torque drag are very low compared to contracting radial shaft seals.
- Service life is considerably higher than radial seals in contaminated environments and can extend to thousands of hours.

**Construction:** The VRM01 seal lip is made from an 80 durometer nitrile rubber with very good wear resistance.

**Temp-range:** Generally the same as NBR V-rings or -40°C to 100°C (-40°F to 212°F).

For added protection in extremely contaminated applications, we also offer the type VRM02. The VRM02 seal also seals axially and functions by combining positive lip contact with centrifugal "slinging" action. However, the VRM02 seal is different in that the rubber element is stretch fitted into a metal shell. The metal shell is then press-fitted onto the shaft. This shell provides excellent protection from heavy debris and it automatically accommodates high rotating speeds without auxiliary clamping devices.

#### Advantages/User Benefits:

- The metal shell serves as a support and deflector the rubber body and lip are protected from damage and displacement by external debris (i.e. rocks, viscous media)
- In most cases, the shell also functions as a holder that keeps the rubber lip in position during high surface speeds. No additional axial retention is

required.

- Due to its compact design, narrow installation widths are possible.
- Frictional heat build-up and torque drag are very low compared to contracting radial shaft seals
- Service life is considerably higher than radial seals in contaminated environments and can extend to thousands of hours.

**Construction:** The VRM02 seal lip is made from an 80 durometer nitrile rubber with very good wear resistance.

**Temp-range:** Generally the same as NBR V-rings or -40°C to 100°C (-40°F to 212°F).

## JD PROFILE - FLANGED ROTARY SEAL

### Applications:

- Best choice for sealing rotating shafts, such as pumps, motors and rotary actuators.
- Suitable for pressures to 3000 psi, 21 MPa.

### Features:

- O.D. flange stabilizes seal, prevents seal rotation and resists thermally induced movement.
- Heavy I.D. seal-lip ensures longest life.
- Dual retained spring-energizer for maximum security.
- Low load high-compliance spring energizer.
- Many high-resilience spring-energizer-options, including choice of light, medium and heavy loads (for friction control) and "NACE" corrosion resistance for oil field use.
- Available with silicone-filled cavity for food and drug applications.

## JD PROFILE - FLANGED ROTARY SEAL

### Cavity Dimensioning

Series no.	Cross section	O'ring cross-sect.	Recommended inner Ø range		Groove width L	Groove depth G	Flange width A	Flange depth B	Chamfer width E	Gap max. e	Radius max. R <sub>1</sub>
			≥	<

02540	D	6.99	400.00	700.00	9.50	7.00 +0.10	2.80 -0.20	11.00 +0.15	1.60	0.25	0.50

### Cross Section

Where space permits, use of the largest cross section seal is preferred. If specifying a diameter which is above the recommended diameter range, use the largest recommended diameter for the appropriate cross section to determine the cavity tolerances.

### Compound selection

Sealing surface	Medium	POLON® PTFE compound
Steel	Hydraulic oils, Mineral oils, Lubrication oils	POLON® 031, 012, 052
Steel chromium plated	Water/oil emulsions, Hot water and steam	POLON® 031, 074
Cast iron	Unlubricated and lubricated air, Fire resistant fluids, Phosphate ester	POLON® 031, 012, 074
Stainless Steel	Unlubricated and lubricated air, Fire resistant fluids, Phosphate ester	POLON® 301 074
Aluminium hard soft	all above listed	POLON® 031 POLON® 044, 067

### Compound specifications

Reference	Compound	Colour	Temp. (°C)		Application	Characteristics
			min.	max.		
POLON® 012	Modified PTFE	dark green	-190	+230	Low-duty hydraulic applications	Improved wear resistance
POLON® 031	PTFE +15% carbon	black	-190	+290	Medium mechanical stress Hard sealing surfaces water/oil emulsions	Chemical resistance limited by carbon
POLON® 044	PTFE +15% graphite	black	-190	+230	Low mechanical stress Soft sealing surfaces	Chemical resistance limited graphite
POLON® 052	PTFE +40% bronze	bronze	-156	+260	Heavy mechanical stress Hydraulic applications	Outstanding wear and creep resistance
POLON® 067	PTFE +10% ekonol	beige	-260	+320	Medium mechanical stress Soft sealing surfaces Rotary sealing	Limited chemical resistance Limited use in hot water
POLON® 074	PTFE +10% carbon fibre	greyish	-260	+310	Water hydraulics Seawater Short strokes with high frequency	Very good wear properties in water
